

Volume of Cuboids

A cuboid is a 3D shape that looks like a box. To work out the volume, we need to know 3 measurements; the length, width and height. We then multiply them together. Then write the answer as a cubic number e.g. 3m^3 .

Volume = length x width x height

E.g.

$$10 \times 5 = 50$$

$$50 \times 3 = 150\text{cm}^3$$

Now try these examples:

1)

$$3 \times 3 = 9$$

$$9 \times 3 = 27\text{m}^3$$

2)

$$20 \times 4 = 80$$

$$80 \times 6 = 480\text{cm}^3$$

3)

$$7 \times 2 = 14$$

$$14 \times 2 = 28\text{m}^3$$

4)

$$8 \times 4 = 32$$
$$32 \times 12 = 384\text{cm}^3$$

5)

$$10 \times 15 = 150$$
$$150 \times 1 = 150\text{mm}^3$$

6)

$$9 \times 5 = 45$$
$$45 \times 4 = 180\text{m}^3$$
